

CONTINGENCY PLANNING FOR THE REDUCTION AND MANAGEMENT OF DUST DISASTER RISKS

14 July 2023

12:00 to 13:00 PM CEST

Dust disasters have become a growing concern in recent years, with significant impacts on human health, the environment, and infrastructure.

Contingency Planning for the Reduction and Management of Dust Disaster Risks is an essential component in ensuring the safety and well-being of individuals and communities exposed to hazardous dust phenomena.

The aim of this seminar is to provide a comprehensive understanding of the importance of dust disaster risk management and reduction, as well as contingency planning. During this seminar, various approaches to dust disaster risk mapping/assessment, management and reduction, such as identifying potential hazards, assessing the vulnerability of different regions, and implementing preventative measures will be discussed.

Ali Darvishi Bolorani

Associate Professor at the University of Tehran. His current areas of interest include climate-smart agriculture and land use planning, incorporating vulnerability mapping, risk analysis, climate change impact modelling, and mitigation measures to address climate change, global warming, water scarcity, land degradation and dust storms.
